Why Shades? An Analysis of Contemporary Shading Solutions

Solar Gain and View with MechoSystems' Roller Screens

Energy-efficient transparent shading

The use of glass in buildings has increased. No longer is the window an energy culprit. New energy-efficient glazings with higher degrees of visibility are used at an expanding rate. The solar-shading industry has responded by offering visually transparent shading, which fulfills solar-protection requirements, while maintaining a view to the outside. An effective solution to the problem is MechoSystems' manual MechoShades[®] or motorized ElectroShades[®] in tandem with its exclusive shadecloths. These sunscreens feature small openings among the threads a by-product of the weaving process.

View and solar-protection opportunities

MechoSystems' shadecloths, woven in densities from 0–18% open and available in a variety of colors, from light to dark, complement glazings' heat-gain requirements and solar transmittance. A shadecloth's natural openings assure a uniform view and provide appropriate solar protection. Color and density selection are important in controlling interior brightness, energy efficiency, and glare. Recent studies have found that a shadecloth's composition can also play a factor in solar transmittance. Shadecloths composed of filament polyester materials tend to have a higher solar transmission than MechoSystems' traditional shadecloths.

The alternatives

Venetian- and vertical-blind manufacturers offer mechanically perforated slats and louvers as an alternative to MechoSystems' shadecloths. These devices filter light when the angle of their slats is altered. The slat's opaque composition limits a blind's ability to provide uniform light distribution across a window. To properly filter high visible light, a translucent material with a uniform scrim effect and low-density factor of 0–18% open is needed. MechoSystems' shadecloths offer uniform transparency with less distortion of the view and appropriate solar control. (Calculations are based on 40° N. lat. and the nearest whole degree of solar time.)

The vertical solar ray (or altitude) effects the depth of solar penetration.

Protection from solar gain with partially drawn solar-screen shades (section view).

View through and under partially drawn rollerscreen shades.

The dynamic sun

The sun's effect on an interior space is best evaluated by looking at the components of the profile or shadow angle. Evaluate the vertical ray (or altitude) and the horizontal ray (or azimuth) and discover how they impact a person's visual and physical comfort. Solar-heat-gain penetration is greatest in winter due to the low angle of the sun, which generates the greatest amount of discomfort. Flat, woven shadecloths, components of MechoShades® and ElectroShades®, provide visual transparency. The shadecloths effectively complement the vertical and horizontal solar rays. Louvered-shading products of opaque materials tend to be left open because people want a view.

Visually transparent shades

Manual MechoShades® and motorized ElectroShades® are visually transparent systems and most aptly complement solar geometry by providing a cut-off angle similar to an awning or overhang. To provide protection from the sun in a south-facing window, the shade must be lowered only halfway. This single position permits more winter heat and less summer heat to enter the interior space. Thus, the changing seasons are appropriately complemented. MechoShade Systems' flat-shadecloth design eliminates the need for continuous readjustment throughout the day. And the hardware design permits convective airflow around the shade to reduce thermal stress.

Glare and view with shades

Roll-down manual or motorized shades provide effective shading of workstations, monitors, and people by reducing direct solar penetration. A woven shadecloth with density and color suitably matched to the glass permits a view through the unshaded portion of a window, as well as a diminished view through the shadecloth. This configuration creates a sense of the outside. Unlike horizontal or vertical blinds, which will obstruct views at any angle. Fully lowered MechoShades® or ElectroShades® offer a panoramic view. A fully raised shade can completely disappear with no stack at the top-in contrast with vertical or horizontal blinds, which can have an unsightly stack.

The horizontal solar ray (or azimuth) affects personal comfort.

Protection from solar gain with partially drawn shades (plan view).

Glare control on the monitor and a view under partially drawn roller-screen shades.

Solar Gain and View with Horizontal and Vertical Blinds

Total solar gain and view with open horizontal-slat blinds, offering little heat reduction.

Total solar gain with open horizontal blinds. Notice the horizontal striations on the monitor.

Solar gain and view with horizontal blinds

An open horizontal-slat blind (or Venetian blind) provides little to no solar protection. The published shading coefficient of an open Venetian blind reveals that it is similar to unshaded glass. A Venetian blind is open at 0°, fully closed at 69°, and $\frac{2}{3}$ closed at 45°. Tilted Venetian-blind slats can reduce heat gain, but the outside view will be reduced accordingly. Therefore, the reduction in heat gain and view occurs at an increasing rate when the tilt angle is more than 25°. Published data indicates that effective heat gain can only be achieved when the view has been almost obliterated—especially for someone sitting near the window wall.

Glare on monitors-view with horizontals

Office interiors require computer monitors near a window wall. Direct and diffused illumination through and off the surfaces of horizontal-slat (or Venetian) blinds tends to cause disturbing patterns on the screen of monitors. The solution is to shut the slats of the blinds. However, the window wall will become opaque and the view obliterated. For a view to the outside, the blinds may be raised halfway up, but this condition will block the top half of the window and leave the bottom half unshaded. In this typical configuration, the Venetian blinds are attempting to simulate a half-drawn roller shade. Generally, for Venetian blinds to be effective, the entire view to the outside must be sacrificed.

Reduced solar gain and view with partially open horizontal blinds.

Horizontal louvers, which produce undesirable striations on computer monitors.

Total solar gain and view with fully or partially open vertical blinds. (plan view)

Total solar gain and view with the use of open vertical blinds. Notice the vertical striations on the monitor.

Solar gain and view with vertical blinds

Open vertical louvers are approximately equivalent to an unshaded window with similar glazing. The horizontal solar rays that impact vertical louvers are similar to the vertical rays on Venetian blinds. The sun is dynamic and can arc up and around a window as much as 30° between 11 a.m. and 1 p.m. It is difficult, probably impossible, to manually adjust vertical louvers hourly so that they are effective. More often, vertical louvers are left open. In the section drawing (right), the sun is above the 41° cut-off angle, where a reduction in solar gain is not possible. Below the 41° angle, solar gain is indirect but not diminished.

Glare on monitors-view with verticals

The average person's field of vision is about 160° horizontally and 60° vertically. Because vertical blinds have a cut-off angle of about 41°, the outside view is dramatically diminished as people move closer to the window wall. Solar-lit vertical louvers create striated shadows on monitor screens. To reduce or eliminate the effect, the louvers must be closed, but the view to the outside will be obliterated. The sun is dynamic and moves so rapidly over and across a typical south-facing window that the louvers must constantly be adjusted. However, when the louvers are rotated closed, a person's field of vision is narrowed to zero—or completely eliminated.

A diminished view with partially opened louvers, resulting in a visual cut-off angle of 41° (section view).

Open vertical blinds will create disturbing patterns on computer monitors.

The single-source solution for shading

MechoShade Systems is the only single-source designer and manufacturer of solar-shading hardware, shadecloths, electronic-control systems, and accessories.

The company has become known for its shadecloths that:

- are technically advanced.
- provide light control and solar protection.
- offer comfort and views to the outside.
- incorporate a diverse and extensive selection of colors, patterns, and weaves.
- range from visually transparent to opaque.
- include unique design characteristics to serve the requirements of new glazing.

Wide range of shadecloths and densities

Blackout, Dimout, and Film – (0–1% open)		
Specialty room-darkening and privacy materials		
Equinox [™] Blackout Shadecloth	0100 Series	
Midnite [™] Blackout Shadecloth	0200 Series	
MirroFilm™	0600 Series	
Classic Blackout Shadecloth	0700 Series	
AcoustiVeil [™] Shadecloth	0890 Series	

ThermoVeil[®] Basket Weaves—(3–10% open) 2 x 2 basket-weave shadecloths

ThermoVeil® Dense Basket Weave 1300, 1500 Series ThermoVeil® Open Basket Weave 2100 Series

ThermoVeil[®] Vertical and Satin/Diamond Weaves – (0–3% open)

Technically advanced and lineally woven shadecloths

ThermoVeil® Vertical Privacy Weave 0900 Series ThermoVeil® Dense Vertical Weave 1000 Series ThermoVeil® Reversible

Satin/Diamond Weave 3000, 3200, 3300 Series

EuroVeil® and EuroTwill®—(2–5% open) Thin, fine screencloths with soft textures

EuroVeil[®] Basket Weave 5300 Series EuroTwill[®] Reversible Weave 6000, 6200 Series EuroTwill[®] Reversible Broken Weave 6450 Series

Designer Collection-(2-13% open)

Sophisticated interwoven patterns	
Oxford Row	5100 Series
Classic Twill Weave	5200 Series
Antique Linen	5400 Series
Sarah	8200 Series
Dot	8300 Series
Orchid	8400 Series
Bamboo	8600 Series
Swirl	8700 Series

Bogota Series – (5% open) FR, PVC-free, and Oeko-Tex® Standard 100 Certified shadecloths Bogota Aluminum Back 0500 Series

Bogola / laminam Baok	
Bogota	0550 Series

The closed-loop manufacturing cycle of this TPO-thermoplastic olefin-based material allows for EcoVeil® to be repolymerized and woven again into a new shadecloth or made into something else-endlessly.

The EcoVeil[®] Series was inspired by the book *Cradle to Cradle: Remaking the Way We Make Things* by William McDonough with his associate Michael Braungart, a German chemist.

EcoVeil[®] Screens, a member of the EcoVeil[®] family, became the first environmentally certified product of its kind.

The manual Mecho[®]/5 system with EcoVeil[®] is the first complete windowcovering solution to be Cradle to Cradle Certified^{CM} silver by MBDC, McDonough and Braungart's firm. EcoVeil[®] Naturals, another Cradle to Cradle Certified^{CM} fabrication in the EcoVeil[®] family:

- is a commercial-quality jacquard weave.
- has a residential aesthetic.
- echoes traditional window coverings made of natural reeds, grasses, and woven woods.
- became the first eco-friendly sun screen with character and finesse.

EcoVeil[®] Screens EcoVeil[®] Screens EcoVeil[®] Screens EcoVeil[®] Naturals 0950 Series (1% open) 1350 Series (5% open) 1550 Series (3% open) 8050 Series (1–2% open)

The EcoVeil® Naturals, like others in the EcoVeil® family, are Cradle to Cradle Certified^{CM} shadecloths. They are woven into highly textured jacquards, reminiscent of traditional window coverings made of natural reeds, grasses, and woven woods.
